

GIC Mockup Studio - Professional User Manual (v1.0)

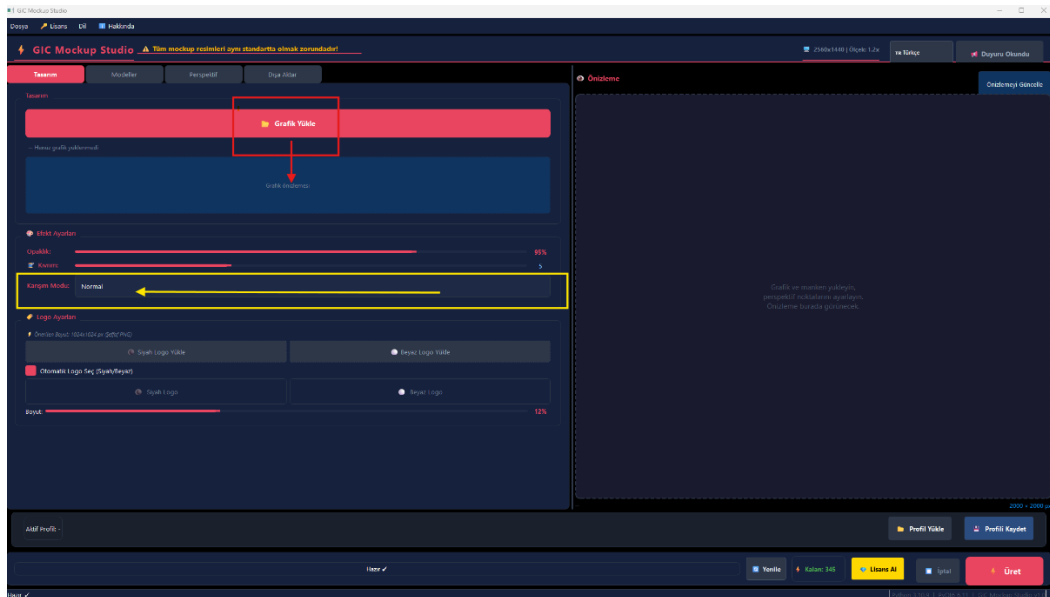

Welcome to GIC Mockup Studio! Thanks to the Advanced DTG Mockup Engine, you can transform your designs into ultra-realistic, watermarked, and automatically named professional presentations in seconds.

1. Design and Effects

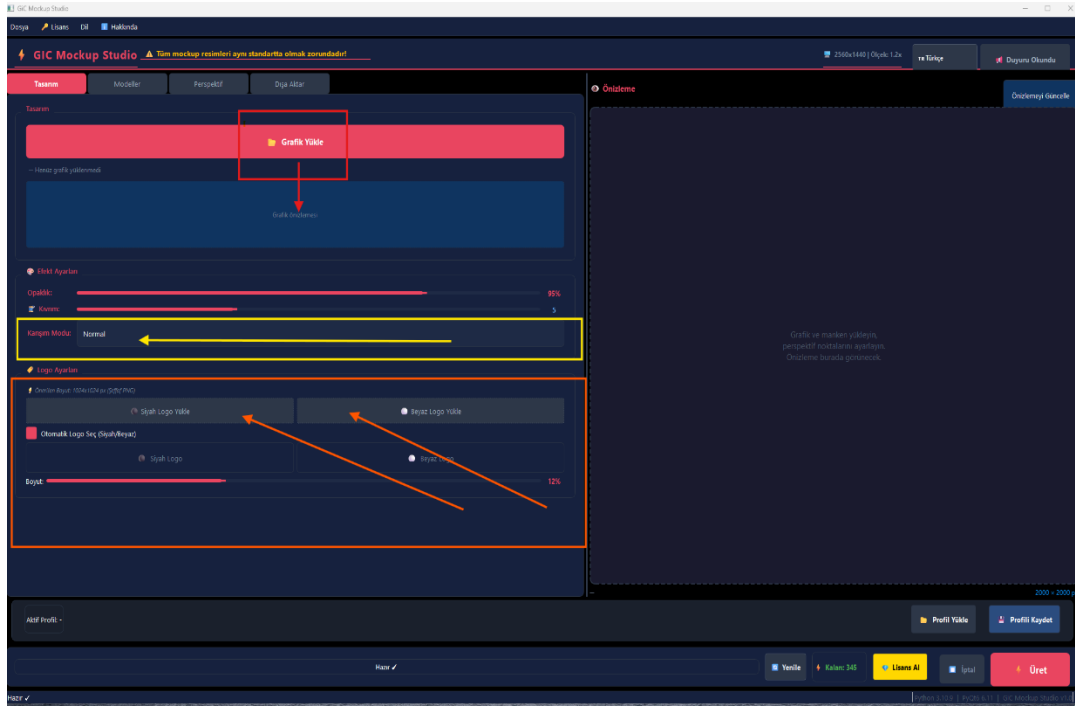

- **Loading an Artwork:** Drag and drop your main graphic (PNG/JPG) into the area in the "Design" tab, or click the button to upload.

- **Realistic Effects:** Use the *Opacity*, *Displacement (Fold)*, and *Blend Mode* (e.g., Multiply) settings to perfectly capture the fabric texture.

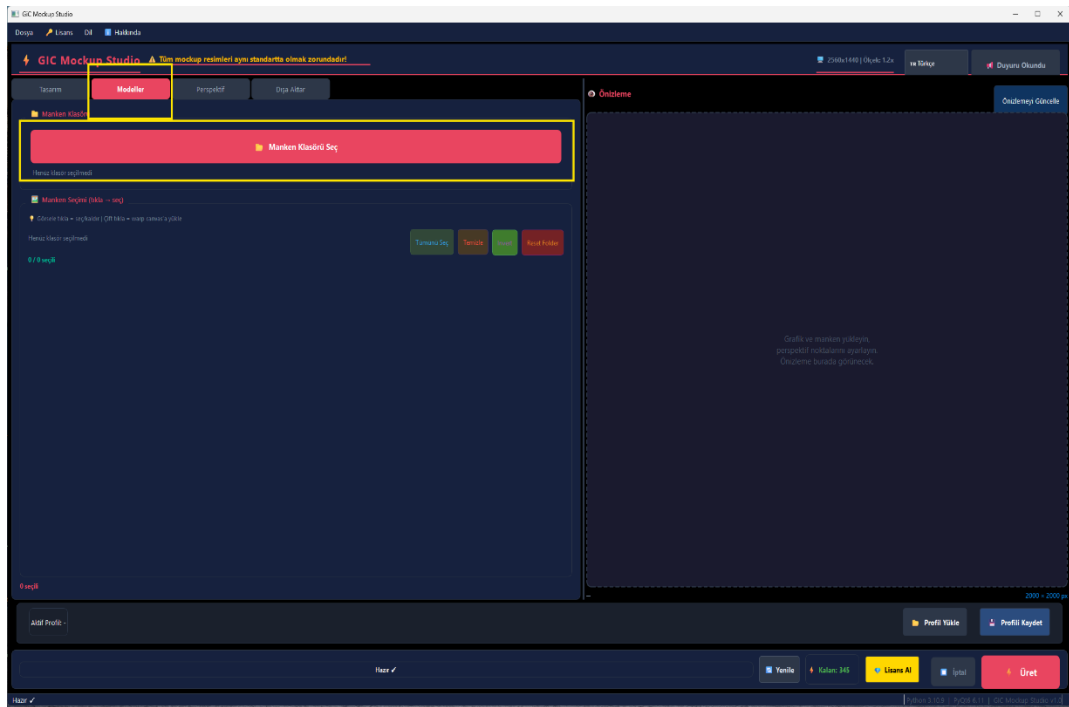

- **Brand Logo:** The system can automatically select a black/white logo based on the design, or you can permanently add your own brand logos to the system using the "Upload Custom Logo" buttons.

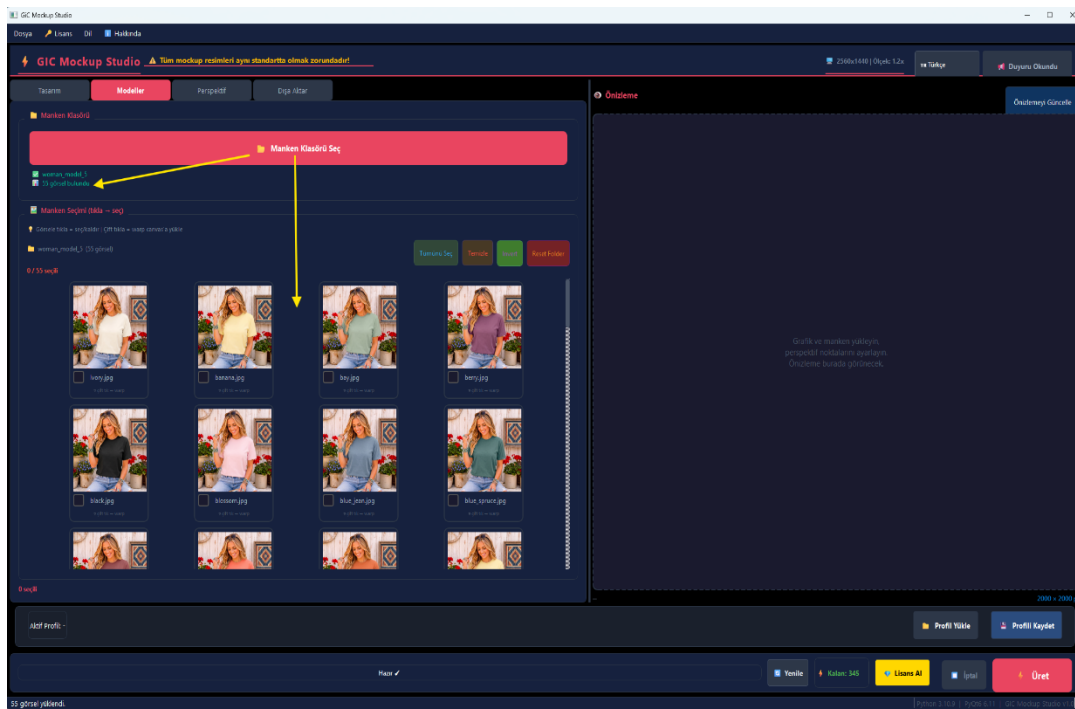

2. Model Selection

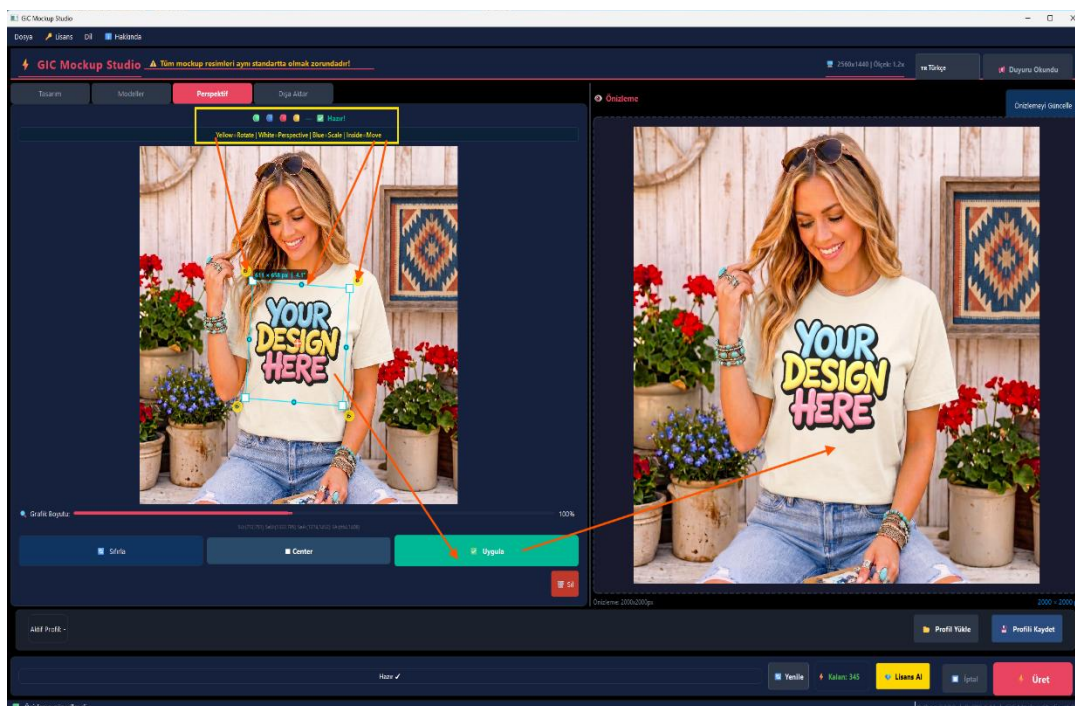

- Select the folder containing your models from the "Models" tab.

- **Single-click** on the images you want to select for production.

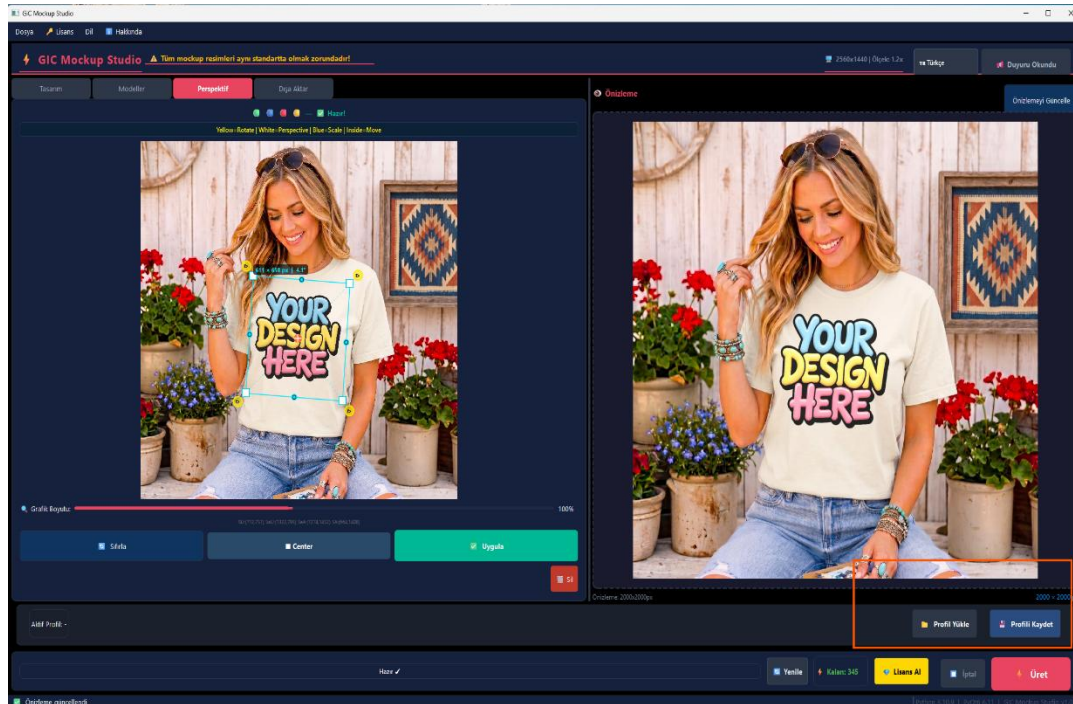

- **Double-click** on the model you want to adjust the perspective for. This will send it to the preview screen and perspective canvas on the right.

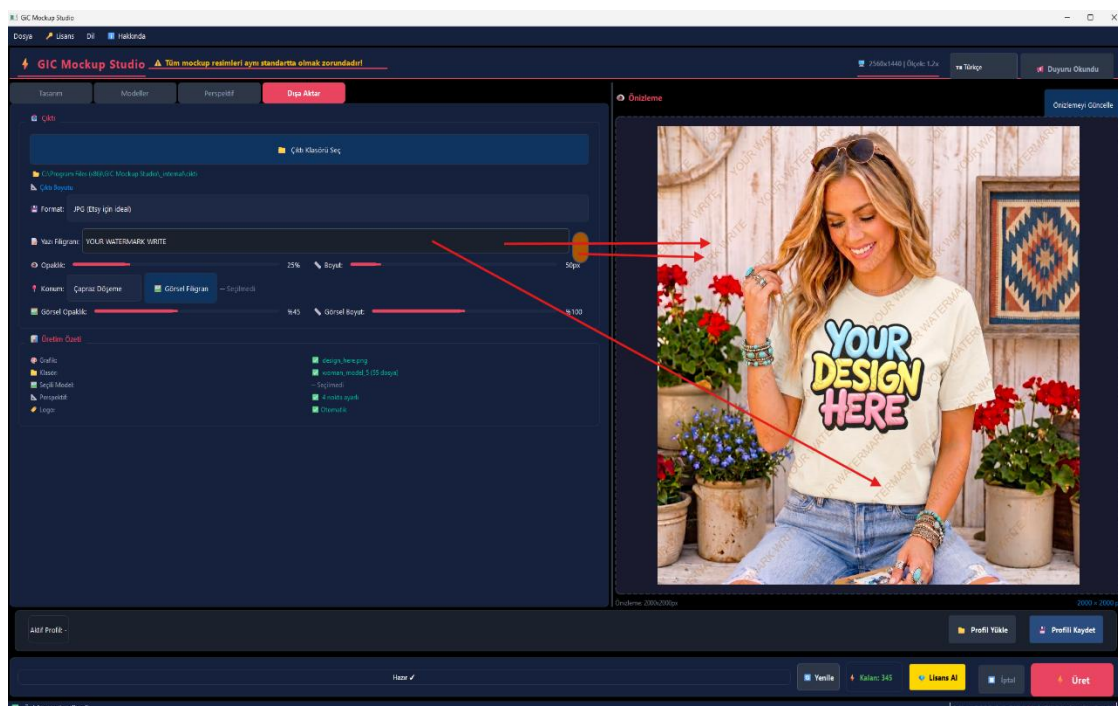

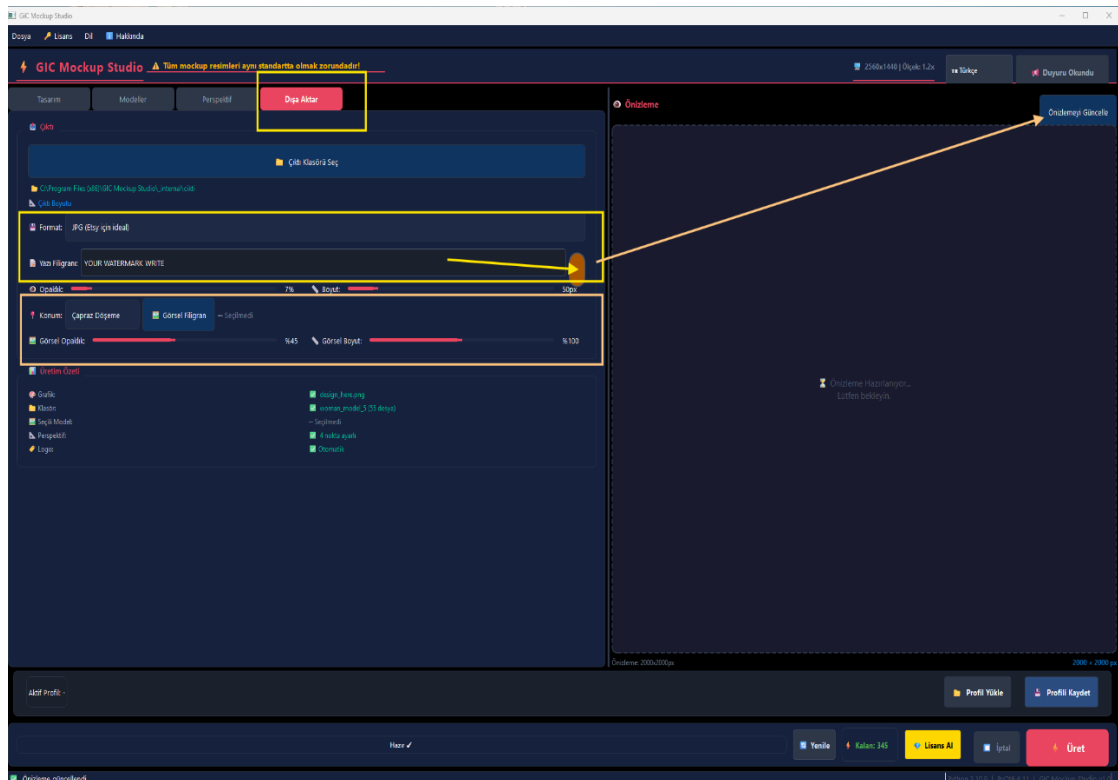

3. Perspective (Warp) and Profile System

- **Perspective:** In the "Perspective" tab, drag the 4 red dots (Top Left, Top Right, Bottom Right, Bottom Left) to the corners to determine the placement of your design on the model.
- You can scale the design with the *Graphic Size* slider and center it with the *Center* button.
- **Saving Profiles:** You can save your perspective, effect, and watermark settings with the "Save Profile" button. For different designs, you can recall the exact same settings in seconds by clicking "Load Profile".

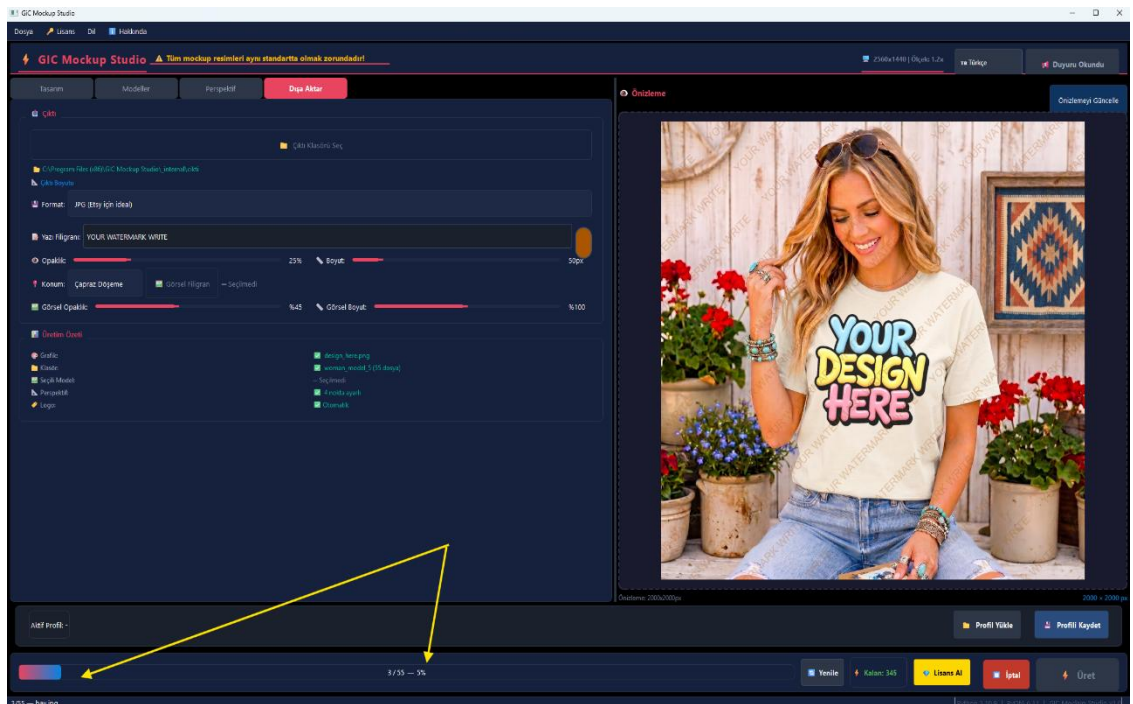

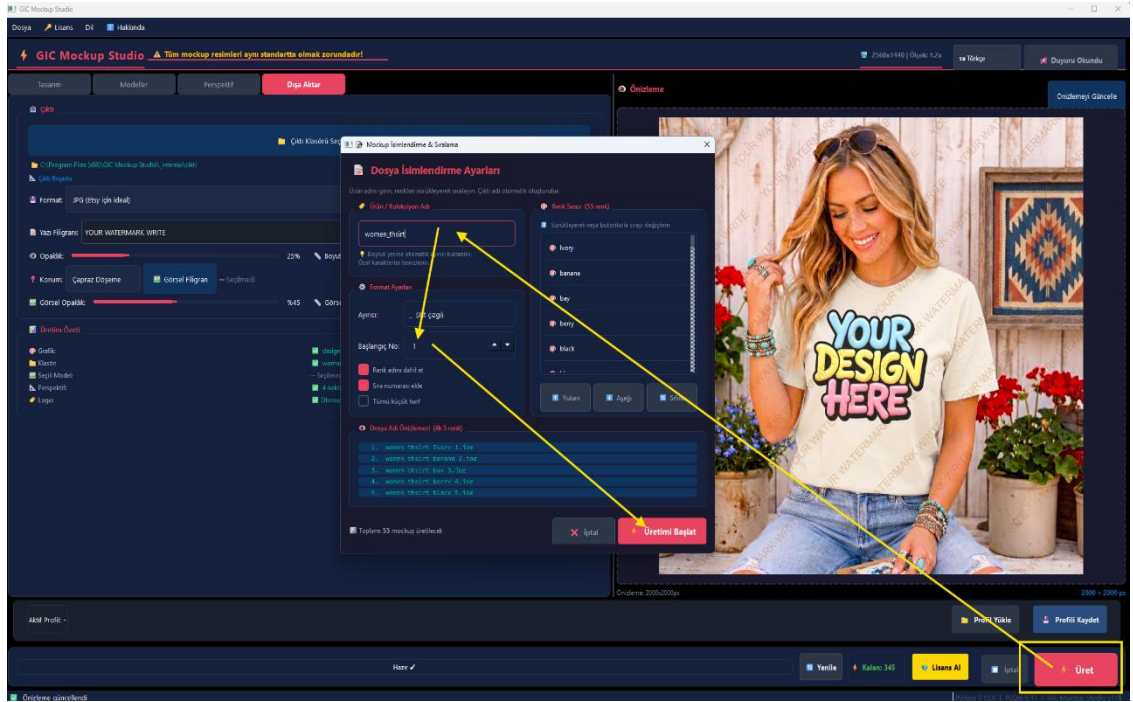

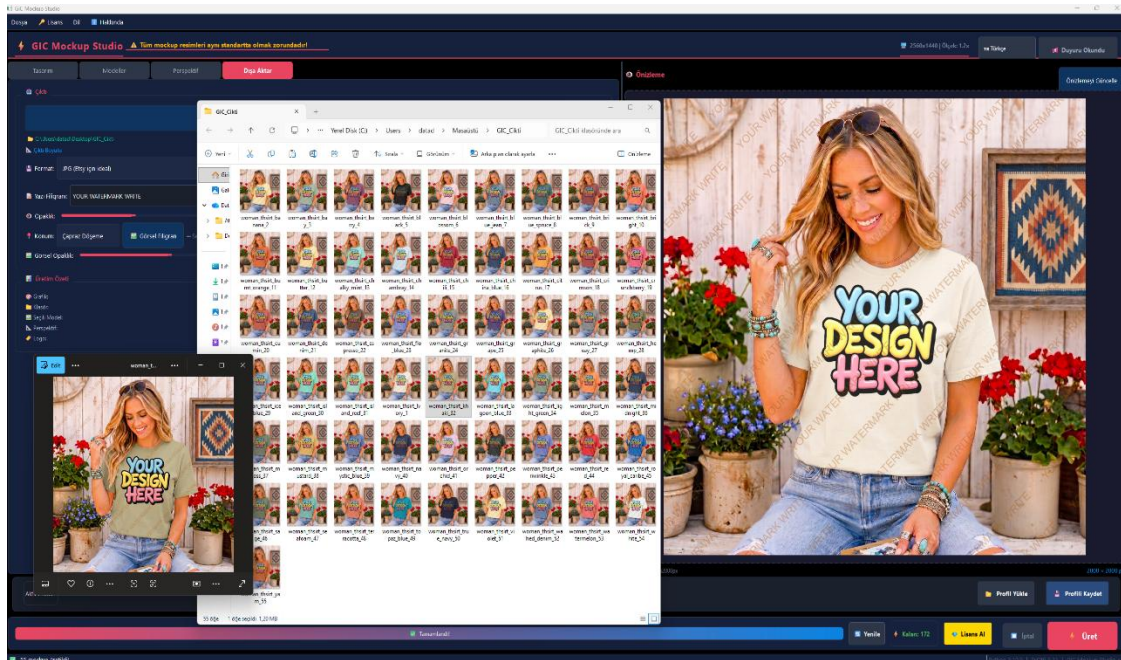

4. Advanced Watermark and Export

- **Output Settings:** Determine your output folder and format (High-Quality PNG or Etsy-optimized JPG) from the "Export" tab.
- **Watermark:** To protect your designs, you can add a Text watermark (with custom color and size options) or an Image watermark. Easily adjust their position and opacity.

- **Smart Production:** When you click the "⚡ Generate" button, enter your product name in the Mockup Naming screen that opens and drag the colors to sort them. The system will automatically name and generate your files.

💡 Quick Tips and Important Rules

- ⚠️ **Important Rule:** For the profile system and perspective engine to work flawlessly on all photos, it is mandatory that all mockup images in your selected folder are of the same standard (same resolution and alignment).
- **Precise Perspective Adjustment:** In addition to your mouse, you can move the perspective points pixel by pixel using the Arrow Keys on your keyboard. Hold down the Shift key to move them 5x faster.
- **Real-Time Preview:** When you release the adjustment sliders, all changes are instantly displayed on the right panel.
- **License:** You can check your remaining production credits on the bottom bar. For unlimited production, you can activate your PRO key from the "🔑 License" tab on the bottom menu.
